THE WILLIAMES CUTTING LINE is used when all or part of a new seasons annual plantings are cuttings taken from parent stock, or when a large percentage of new seedlings are derived from cuttings, rather than from seed.

The pneumatic cylinder is designed to lift and lower an array of pins of a precise diameter to quickly and automatically form a hole in the centre of each tray cell for placing plant cuttings taken from parent stock.

The number of pins are changed to match different tray cell numbers and configurations.
